You are given a spreadsheet that contains a list of  $N$  athletes and their details (such as age, height, weight and so on). You are required to sort the data based on the  $K^{\text{th}}$  attribute and print the final resulting table. Follow the example given below for better understanding.

Rank	Age	Height (in cm)		Rank	Age	Height (in cm)
1	32	190		5	24	176
2	35	175	sort based on k=1	4	26	195
3	41	188	→	1	32	190
4	26	195	i.e (age)	2	35	175
5	24	176		3	41	188

Note that  $K$  is indexed from  $0$  to  $M - 1$ , where  $M$  is the number of attributes.

**Note:** If two attributes are the same for different rows, for example, if two athletes are of the same age, print the row that appeared first in the input.

**Input Format**

The first line contains  $N$  and  $M$  separated by a space.

The next  $N$  lines each contain  $M$  elements.

The last line contains  $K$ .

**Constraints**

$1 \leq N, M \leq 1000$

$0 \leq K < M$

Each element  $\leq 1000$

**Output Format**

Print the  $N$  lines of the sorted table. Each line should contain the space separated elements. Check the sample below for clarity.

**Sample Input 0**

```

5 3
10 2 5
7 1 0
9 9 9
1 23 12
6 5 9
1

```

**Sample Output 0**

```

7 1 0
10 2 5
6 5 9
9 9 9
1 23 12

```

**Explanation 0**

The details are sorted based on the second attribute, since  $K$  is zero-indexed.
